A Smart, Laser-Guided Putting Aid for the Modern Golfer

PuttOnce™ is a groundbreaking putting tool designed to revolutionize the way golfers read greens and improve their putting precision. This smart, portable device uses a green laser guidance system and a pair of sensors to analyze the slope and distance to the hole. Paired with an AI-powered app, it offers players real-time visual and audio guidance to help perfect their putting line, pace, and confidence.

Why This Matters

- Putting accounts for 40% of strokes in most rounds.
- Yet no device exists today that can accurately read greens and teach aim and pace in one simple experience.

PuttOnce™ does exactly that — and can align with any brand seeking to promote innovation and performance in golf.

We are currently seeking introductions to potential sponsors or industry partners who may want early involvement. The goal is to fund the development of a

designed to assist golfers in reading greens.

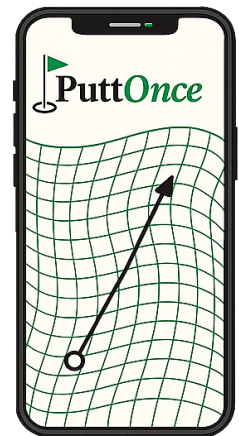

working prototype, including hardware sourcing, software development, and real-world testing.

This initiative is being led by Albert Harlow and Sons, Inc., the holding company currently managing development, with support from Click IT by Motherboard, Inc. There is a patent pending, with further filings expected to fully protect the brand and intellectual property.

Step 1 - Standing over the ball, the Golfer aims PuttOnce at the hole keeping it level and presses button to take the reading.

Step 2 - Golfer places PuttOnce on the green next to the ball pointed to the hole and PuttOnce displays the recommended pace on the LEDs.

We envision a Mini model which simply displays the recommendations of aim and pace after reading. PuttOnce will also come with an App.
